		if K closed, $f \in C^0(K)$, coercive then at least one solution

	Find a local solution
No constraints	Gradient Descent
Affine constraints	Penalty methods
Non-linear constraints	

Introduction

Aim of the lecture: a general presentation of one numerical methods for constrained optimization.

- **Penalty methods** \rightsquigarrow equality constraints

- **Projected gradient methods** \rightsquigarrow inequality constraints

well suited if constraints projection is possible and easy to compute.

a)

Given a real number $c \geq 0$, consider the **penalty problem**:

$$\inf_{x \in \mathbb{R}^n} Q_c(x) := f(x) + \frac{c}{2} \|h(x)\|^2. \quad (P_c)$$

1. *Journal of Management Studies*, 1997, 34, 1, 1-14.

$$\inf_{x \in \mathbb{R}} x, \quad \text{subject to: } x = 0.$$

- 1 What is the solution \bar{x} to the problem?
- 2 Calculate the solution x_c to the corresponding penalized problem P_c .
- 3 Verify that $x_c \xrightarrow{c \rightarrow +\infty} \bar{x}$.

Quadratic penalization

Figure: Graph of Q_c , for various values of c

100

- For all $k \in \mathbb{N}$, x_k is the **solution** to (P_{c_k}) .
- The sequence $(x_k)_{k \in \mathbb{N}}$ **converges**, let \bar{x} denote the limit.
- There exists \tilde{x} such that $h(\tilde{x}) = 0$.

1. *Journal of the American Medical Association*, 1997; 277: 1039-1043.

$$Q_{c_k}(x) = f(x) + \frac{c_k}{2} \|h(x)\|^2 = f(x).$$

1. *Journal of Management Studies*, 1997, 34, 1, 1-14.

$$\begin{aligned} c_k \|h(x_k)\|^2 &= Q_{c_k}(x_k) - f(x_k) \\ &\leq Q_{c_k}(\tilde{x}) - f(x_k) && [\textit{Optimality of } x_k] \\ &= f(\tilde{x}) - f(x_k). && [\textit{Equality of Step 1}] \end{aligned}$$

11. $\frac{1}{2} \ln 2$

$$\|h(x_k)\| \leq \sqrt{M/c_k}, \quad \forall k \in \mathbb{N}.$$

Quadratic penalization

Step 3. Optimality of \bar{x} . Let x be feasible. We have

$$\begin{aligned}
 f(x_k) &\leq f(x_k) + c_k \|h(x_k)\|^2 \\
 &= Q_{c_k}(x_k) \\
 &\leq Q_{c_k}(x) && [\textit{Optimality of } x_k] \\
 &= f(x). && [\textit{Equality of Step 1}]
 \end{aligned}$$

Passing to the limit, we get

$$f(\bar{x}) \leq f(x).$$

Thus \bar{x} is optimal.

Quadratic penalization

The result of the lemma must be seen as an “ideal” situation.

Difficulties in practice:

- The problem (P_c) **may not have a solution**, even if (P) has a solution. Example:

$$\inf_{x \in \mathbb{R}} x^3, \quad \text{subject to: } x = 0.$$

- The sequence $(x_k)_{k \in \mathbb{N}}$ may not converge.
- The problem (P_c) is **hard to solve** when c is large, it is likely to be ill-conditioned (see next example).

Quadratic penalization

Example. Consider:

$$\inf_{(x,y) \in \mathbb{R}^2} \frac{1}{2} (x^2 + (y-1)^2), \quad \text{subject to: } x = y.$$

Projection problem of the point $(0, 1)$ on the line $\{(x, y) \mid y = x\}$.

Exercise. Verify the following statements.

- Solution: $x^* = (0.5, 0.5)$.
- Solution of P_c , the penalty function, is:
$$\begin{pmatrix} x_c \\ y_c \end{pmatrix} = \frac{1}{1+2c} \begin{pmatrix} c \\ 1+c \end{pmatrix}.$$
- There exists a constant M such that for all $c \geq 0$,

$$\|(x_c, y_c) - (\bar{x}, \bar{y})\| \leq M/c.$$

Quadratic penalization

Figure: Graph of Q_c , for $c = 0$.

Quadratic penalization

Figure: Graph of Q_c , for $c = 0.5$.

Quadratic penalization

Figure: Graph of Q_c , for $c = 1$.

Quadratic penalization

Figure: Graph of Q_c , for $c = 2$.

Quadratic penalization

Figure: Graph of Q_c , for $c = 5$.

Penalty algorithm

General idea: increase the value of c progressively, to mitigate the difficulty of minimizing Q_c .

Algorithm:

- 1 Input: Choose $c_0 > 0$, starting point $x_0 \in \mathbb{R}^n$.
- 2 For $k = 1, \dots, K - 1$, do
 - Solve (P_{c_k}) (e.g. with a gradient descent algorithm starting from x_{k-1}) and set x_k the solution.
 - If x_k is such that $h(x_k) = 0$, stop.
 - Otherwise choose $c_{k+1} > c_k$.

End for.

- 3 Output: x_K .

Penalty algorithm

$$Q_c(x) = f(x) + \frac{c}{2} \|h(x)\|^2$$

$$\begin{aligned}\nabla Q_c(x) &= \nabla f(x) + c \langle h(x), \nabla h(x) \rangle \\ &= \nabla L(x, ch(x))\end{aligned}$$

$$c_k h(x_k) \simeq \bar{\mu}$$

Augmented Lagrangian

Unlike the penalty method, with the **augmented Lagrangian method** is not necessary to take $c \rightarrow \infty$ in order to solve the original constrained problem, avoiding ill-conditioning.

Augmented Lagrangian

The two ideas of the **augmented Lagrangian method**:

- 1 Solving a penalty problem (like (P_c)) also yields an approximation of the Lagrange multiplier.
- 2 We can “improve” the penalty function Q_c with the knowledge of that approximation.

Algorithm: at each iteration,

- the penalty parameter is increased
- the approximations x_k of the solution and λ_k of the Lagrange multiplier are improved.

Augmented Lagrangian

Let $c > 0$. The **augmented Lagrangian** $L_c: \mathbb{R}^n \times \mathbb{R}^m \rightarrow \mathbb{R}$ is defined by

$$L_c(x, \mu) = f(x) + \langle \mu, h(x) \rangle + \frac{c}{2} \|h(x)\|^2.$$

$$\begin{aligned} \nabla L_c(x, \mu) &= \nabla f(x) + \langle \mu, \nabla h(x) \rangle + \langle ch(x), \nabla h(x) \rangle \\ &= \nabla L(x, \mu + ch(x)) \end{aligned}$$

$$\mu_k + c_k h(x_k) \simeq \bar{\mu}$$

$$h(x_k) \simeq \frac{\bar{\mu} - \mu_k}{c_k}$$

$$\mu_{k+1} = \mu_k + c_k h(x_{k+1})$$

- $f(x_{c,\mu})$ is small
- $\frac{c}{2} \|h(x) + \frac{\mu}{c}\|^2$ is small $\rightarrow \|h(x) + \frac{\mu}{c}\|$ is very small
 $\rightarrow \|h(x)\|$ is very small.

Augmented Lagrangian

The new **penalty problem**:

$$\inf_{x \in \mathbb{R}^n} L_c(x, \mu). \quad (P_{c,\mu})$$

Lemma 2

Let \bar{x} be a local minimizer of (P) . Under technical assumptions, there exists $\bar{\mu}$ and $\bar{c} \geq 0$ such that for all $c > \bar{c}$,

- the **KKT conditions** hold true
- \bar{x} is a **local solution** to $(P_{c,\bar{\mu}})$.

Reminders

	Necessary conditions	Sufficient conditions
Abstract formulation (exist.)		if K compact, $f \in C^0(K)$ then at least one solution
		if K closed, $f \in C^0(K)$, coercive then at least one solution

	Necessary conditions	Sufficient conditions
Blue constraints $K = \mathbb{R}^d$ (opt.)	if \bar{x} local sol., $f \in C^2(K)$ then, $D^2f(\bar{x})$ is positive semi-def.	if $f \in C^2(K)$, $\nabla f(\bar{x}) = 0$, $D^2f(\bar{x})$ positive def. then \bar{x} local sol.
Affine constraints	\bar{x} local sol. then KKT	f convex, then KKT=global sol.
Non-linear constraints	\bar{x} local sol., LICQ then KKT	f convex, h affine, g convex, then KKT=global sol.

Augmented Lagrangian

The new **penalty problem**:

$$\inf_{x \in \mathbb{R}^n} L_c(x, \mu). \quad (P_{c,\mu})$$

Lemma 3

Let \bar{x} be a local minimizer of (P) . Under technical assumptions, there exists $\bar{\mu}$ and $\bar{c} \geq 0$ such that for all $c > \bar{c}$,

- the **KKT conditions** hold true
- \bar{x} is a **local solution** to $(P_{c,\bar{\mu}})$.

Idea of proof. We have

$$\nabla L_c(\bar{x}, \bar{\mu}) = \nabla L(\bar{x}, \bar{\mu} + c h(\bar{x})) = \nabla L(\bar{x}, \bar{\mu}) = 0.$$

$$\nabla^2 L_c(\bar{x}, \bar{\mu}) = \nabla^2 L(\bar{x}, \bar{\mu}) + c \langle \nabla h(\bar{x}), \nabla h(\bar{x}) \rangle$$

For c large enough, $\nabla^2 L_c(\bar{x}, \bar{\mu})$ is positive definite.

Therefore, \bar{x} is a local solution.

Augmented Lagrangian

Example 1. Consider $\inf_{x \in \mathbb{R}} x - x^2$, subject to: $x = 0$.

Exercise.

- Write the Lagrangian formulation and find the Lagrangian multiplier.
- Does KKT holds for $\bar{x} = 0$?
- Write the augmented Lagrangian $(P_{c,\bar{\mu}})$ and show that \bar{x} is a local solution to $(P_{c,\bar{\mu}})$ if $c > \bar{c}$.

Augmented Lagrangian

Quadratic penalization

Example 2. Consider:

$$\inf_{(x,y) \in \mathbb{R}^2} \frac{1}{2} (x^2 + (y-1)^2), \quad \text{subject to: } x = y.$$

Projection problem of the point $(0, 1)$ on the line $\{(x, y) \mid y = x\}$.

Exercise. Verify the following statements.

■ Solution: $(\bar{x}, \bar{y}) = (0.5, 0.5)$, $\bar{\mu} = 0.5$.

■ Solution of $(P_{c,\mu})$ (aug. lagrangian):

$$\begin{pmatrix} x_c \\ y_c \end{pmatrix} = \frac{1}{1+2c} \begin{pmatrix} c + \mu \\ 1 + c - \mu \end{pmatrix}.$$

■ There exists a constant M such that for all $c > 0$,

$$\|(x_c, y_c) - (\bar{x}, \bar{y})\| \leq M |\bar{\mu} - \mu| / c.$$

Augmented Lagrangian

Figure: Level-sets $L_c(\cdot, \mu)$, for $c = 1$ and $\mu = 0$.

Augmented Lagrangian

Figure: Level-sets $L_c(\cdot, \mu)$, for $c = 1$ and $\mu = 0, 25$.

Augmented Lagrangian

Figure: Level-sets $L_c(\cdot, \mu)$, for $c = 1$ and $\mu = 0, 5$.

Augmented Lagrangian

Algorithm.

1 Input:

- Initial point and multipliers $(x_0, \mu_0) \in \mathbb{R}^n \times \mathbb{R}^m$
- Initial penalty parameter $c_0 > 0$, initial tolerance $\varepsilon_0 > 0$
- Tolerance $\varepsilon > 0$.

2 Set $k = 0$.

3 While $\|D_x L(x_k, \mu_k)\| > \varepsilon$ and $\|h(x_k)\| > \varepsilon$,

- Find x_{k+1} such that $\|D_x L_{c_k}(x_{k+1}, \mu_k)\| \leq \varepsilon_k$.
- If $\|h(x_{k+1})\|$ is small, set $\mu_{k+1} = \mu_k + c_k h(x_{k+1})$. Reduce ε_k .
- Otherwise, increase c_k .
- Set $k = k + 1$.

End while.

4 Output (x_k, λ_k) .

100

0 0 0

- 0** **11** **78** **9** **9** **1** **6**

$$\inf_{x \in \mathbb{R}^n} L(x, \mu_k). \quad (P_x)$$

where μ_k is found with the following maximization

$$\sup_{\mu \in \mathbb{R}^m} L(x, \mu)$$

Since $\nabla_{\mu} L(x, \mu) = h(x)$, this maximization is solved by iterating with an **ascent gradient step** to approximate the solution of $h(x) = 0$:

- Given a solution x_{k+1} , the Lagrange multiplier is updated by

$$\mu_{k+1} = \mu_k + \alpha h(x_{k+1}),$$

where $\alpha > 0 \rightarrow$ Uzawa's algorithm.

100

- Convergence of such methods can be established only under **convexity assumptions**.
- The stepsize $\alpha > 0$ must in general be small enough to ensure convergence. Instead of a fixed stepsize, one can use

$$\lambda_{k+1} = \lambda_k + \alpha_k g(x_{k+1}),$$

- One may consider instead of the primal problem (P) the dual problem

$$d^* := \sup_{\mu \in \mathbb{R}^m} \inf_{x \in \mathbb{R}^n} L(x, \mu) \quad (P_{\mu_k})$$

and we have $p^* \geq d^*$.

100

- ## Conclusion

[illegible]

-

$$\begin{aligned} L(x_1, x_2, \mu) &= f_1(x_1) + f_2(x_2) + \langle \mu, h_1(x_1) + h_2(x_2) - d \rangle \\ &= \underbrace{\left[f_1(x_1) + \langle \mu, h_1(x_1) \rangle \right]}_{=: L_1(x_1, \mu)} + \underbrace{\left[f_2(x_2) + \langle \mu, h_2(x_2) \rangle \right]}_{=: L_2(x_2, \mu)} - \langle \mu, d \rangle. \end{aligned}$$

- **Two production units**, with two independent production processes represented by the variables

Problem:

$$\inf_{x \in \mathbb{R}^2} -\frac{x_1}{1+x_1} - \frac{x_2}{4+x_2}, \quad \text{s.t.} \quad \left\{ \begin{array}{l} x_1 + x_2 = d \end{array} \right.$$

1. *Journal of the American Medical Association*, 1997; 278: 1019-1024.

If $x_1 + x_2 < d$, the cost associated to constraints is decreased. The incentive μ_k is too big, it must be decreased.

100

- A production process is decomposed over two periods. A **random event** with two outcomes ω_1 and ω_2 , with probabilities p and $(1 - p)$, arises in between.
- Optimization variables:
 - x_1 : decisions taken if outcome ω_1 arises
 - x_2 : decisions taken if outcome ω_2 arises
 - y : decisions taken before the random event.

Example: purchase of gas y on a day-ahead market (that is, on a given day for the next one).

Random event: temperature, which impacts consumption.

Lagrangian decomposition

■ Abstract problem:

$$\inf_{\substack{(x_1, x_2, y) \\ (x_1, y) \in X \\ (x_2, y) \in X}} pf(x_1, y, \omega_1) + (1 - p)f(x_2, y, \omega_2).$$

■ Equivalent problem (with non-anticipativity constraint):

$$\inf_{\substack{(x_1, x_2, y_1, y_2) \\ (x_1, y_1) \in X \\ (x_2, y_2) \in X}} pf(x_1, y_1, \omega_1) + (1 - p)f(x_2, y_2, \omega_2), \quad \text{s.t. } y_2 - y_1 = 0.$$

■ Independent (w.r.t. randomness) sub-problems:

$$\inf_{(x_1, y_1) \in X_1} pf_1(x_1, y_1, \omega_1) + \mu_k y_1, \quad \inf_{(x_2, y_2) \in X_2} (1 - p)f_2(x_2, y_2, \omega_2) - \mu_k y_2.$$
